PREFACE

BORDER LEICESTER

The name "Morton" was chosen for the stud and property name to commemorate the short life of John's great uncle, Morton Reginald Sandland, who was killed at Kokoda, New Guinea in World War II.

The "Morton" Border Leicester Stud (flock no. 2656) was founded in 1959 with the purchase of 13 stud ewes of mainly "Crymelon" blood from the "Tatakeeper" dispersal.

In 2002, Morton joined Lambplan, as an aid to select superior Border Leicesters using the **BORDER \$ index**.

"Morton" will continue to concentrate on producing early maturing Border Leicesters that have large frames and lower micron wool fleeces and correct conformation.

"Morton" has shown successfully at the Adelaide Royal Show since 1973, at Perth from 1974 to 1984, and occasionally at Albury, Melbourne, Hamilton, Launceston, Bendigo, Dubbo and local shows.

Stud rams have been sold to five States and South Africa.

POLL DORSET

The Morton Poll Dorset Stud was founded in 1999 with the purchase of the complete drop of ewe lambs from the dispersal of Harvey Nolan's "Woodend" Stud.

This was followed by the purchase of the complete "Brengeool" Stud of Frank Brennan in April 2000.

Both studs were in Lambplan, and it will be continued at Morton.

Regular AI programs have used the best rams available in Australia and New Zealand.

**BREEDERS
GROUP -
2023 ROYAL
ADELAIDE
SHOW**

HEALTH STATUS & SUGGESTIONS

The Morton flock is accredited free of Brucellosis and tested to MN3V status for Ovine Johne's disease.

All sheep are vaccinated with 6 in 1 twice as lambs and annually thereafter. All sheep are treated at weaning with a selenium and cobalt pellet.

We have had great success in reducing arthritis in lambs by using **Zoetis Glenary 7 in 1 B12 vaccine**.

RECOMMENDATIONS TO CLIENTS

1. Drench all purchases with Ivomectin or Startec type drenches before release onto your pasture.
2. Vaccinate with 6 in 1 annually (If 6 in 1 is not normally used, the purchase of one pack is strongly suggested for your rams as many fatal diseases are covered by 6 in 1).
3. Feed all rams a ration of lupins for 6 weeks prior to mating.
4. Use extra nutritional care for young rams for their first year. (Remember Border Leicesters are only 13/14 months old at sale time – 4 months younger than terminal sires).
5. Keep new rams separate from older rams until after their first mating season.
6. Shear before summer. Provide shade.

TERMINAL CARCASS PRODUCTION (TCP) INDEX

The TCP index has been created to assist producers to achieve both gains in their major production traits, such as post-weaning weight and muscling, as well as focusing on key eating quality traits such as shear force (tenderness) and intramuscular fat (marbling).

The TCP index is designed to suit a production system where:

- all progeny are terminal
- improving growth and muscle is of commercial benefit
- increasing lean meat yield has a positive financial impact
- a small degree of emphasis is included to maintain or improve eating quality

Understanding LAMBPLAN Maternal ASBVs

Weaning weight (WWT) ASBVs estimate the genetic difference between animals in liveweight at 100 days of age. This ram will produce lambs that are, on average, 0.4kg heavier than a ram with a 0 ASBV for WWT.

Rams with more positive ASBVs for post weaning weight (PWWT) produce lambs that grow quicker and reach target weights in a shorter time. This ram will produce lambs that are, on average, 1.25kg heavier than a ram with a 0 ASBV for PWWT.

Rams with more positive ASBVs for eye muscle depth (EMD) produce lambs that have a higher lean meat yield. This ram will produce lambs that have a 0.2mm deeper eye muscle than a ram with a 0 EMD ASBV.

Rams with a higher greasy fleece weight (GFWT) ASBV will produce progeny that cut more wool. This ram will produce progeny that, on average, cut 2.5% more wool than a ram with an ASBV of 0.

Worm egg count (WEC) ASBVs estimate an animals genetic potential for worm burden. More negative WEC ASBVs are desirable. This ram will, on average, sire progeny that will have 5% fewer eggs/gram than a ram with an ASBV of 0.

WWT (kg)	MWWT (kg)	PWWT (kg)	FAT (mm)	EMD (mm)	NLW (%)	GFWT (%)	SC (cm)	WEC (%)	INDEX
0.8	1.0	2.5	-0.4	0.4	4	5	0.6	-10	105.6
51	53	61	45	38	33	37	44	37	

Rams with more positive ASBVs for maternal weaning weight (MWWT) will produce daughters which will wean heavier lambs. This ASBV reflects a combination of the daughter's ability to milk and provide a better maternal environment.

Rams with a more negative ASBV for fat produce lambs that are leaner, at the same weight. This ram will produce lambs that are 0.2mm leaner at the GR site when compared to a ram with a FAT ASBV of 0.

Rams with a more positive number of lambs weaned (NLW) ASBV will sire daughters that wean a higher percentage of lambs. This ram with an ASBV of 4 will sire daughters which, on average, will wean 2% more lambs.

Rams with higher scrotal circumference (SC) ASBVs will sire daughters that are, on average, more fertile.

An index is a guide to the value of a ram for a particular market. Rams with higher indexes will produce lambs that are more suited to that particular market target. In many cases the indexes used for maternal breeds are in \$ terms.

Border Leicester Cross (BLX)

The BLX index is for a first cross operation where maternal sires are joined to Merino dams, with the first cross female offspring then used in prime lamb systems joined to terminal sire rams. The index favours high early growth animals with good reproduction.

Typical trait changes with the BLX index include:

- maintaining fleece weight
- increasing growth
- increasing adult weight
- increasing maternal weaning weight
- improving carcase traits
- increasing number of lambs weaned

Figure 1 illustrates which traits are in the BLX index and how much they contribute to the overall balance of the index. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

BLX aims to maintain adult weight at current levels because bigger ewes have higher feed and animal handling costs. However, this is difficult to achieve in practice because bigger ewes also produce more lambs, which reach sale weight faster, so the index makes a trade-off to achieve an optimal balance across all traits.

The BLX Index cannot and should not be compared to the Maternal \$ Index you might see in other publications.

Figure 1 shows that increasing adult weight has a negative contribution on the index. However, individual ram breeders who measure early growth, adult weight and reproduction will have greater control over this balance.

Figure 1: The traits in the BLX index and how they contribute to the overall balance of the index

© Sheep Genetics 2020

Updates to the BLX Index

Number of Lambs Weaned (NLW) has been replaced by an improved ASBV called **Weaning Rate (WR)**. This new ASBV has been included in the BLX index.

Sheep Genetics has released a new trait that measures reproductive performance called Weaning Rate (WR). WR combines the traits of Conception (CON), Litter Size (LS) and Ewe Rearing Ability (ERA) into a single ASBV for selection. From 2022 onwards WR has replaced the previous trait of Number of Lambs Weaned (NLW) and has been included in the BLX index.

As a result of the introduction and inclusion of WR in the BLX index there have been changes in the percentiles for the analysis. You may notice that the 50th percentile for the analysis has changed compared to last year.

This ram sale season it will be important to use the percentile band table to re-benchmark what the percentiles are to assist with ram purchasing decisions.

To access the current percentile bands table please use the QR code below of the left. For further information on Weaning Rate please use the QR code on the right and refer to page 4 of the Sheep Genetics 2022 Analysis Enhancement Documentation.

Access the current First-Cross Sire Percentile Band Table

NOTES

LAMBPLAN

How to read a LAMBPLAN report Terminal

Animals with low birth weight EBVs produce smaller lambs with potentially less lambing problems due to birth size.

Animals with positive EBVs for growth produce lambs that grow quicker and reach target weights in a shorter time. This ram will produce lambs that are 2.75 kgs heavier than a ram with a 0 EBV for growth.

An index is a guide to the value of a ram for a particular market target, rams with higher indexes will produce lambs that are more suited to that particular market.

Lot Number	Tag Number	Birth Weight (kgs)	Weaning Weight (kgs)	Growth (kgs)	Fat (mm)	Eye Muscle Depth (mm)	Index
2	01000	0.04	4.0	5.5	-1.5	1.0	154.6

Tag number of the ram showing the year of birth and the identification.

Animals with positive EBVs for Weaning Weight (wwt) produce lambs that grow quicker to weaning. This ram will produce lambs that are 2kg heavier than a ram with a 0 EBV for growth.

Rams with a negative EBV for fat produce lambs that are leaner, independent of the weight of a lamb. This ram will produce lambs that are 0.75 mm leaner at the GR site when compared to a ram at 0.

Rams with a positive eye muscle depth figure produce lambs that have more muscle in their carcass independent of weight. This ram will produce lambs that have a 0.5mm deeper eye muscle.

Terminal Carcass Production (TCP) index

Replacement for Carcass Plus

Key points

- ✔ Carcass Plus has been an important index for the sheepmeat industry but it has been found to have a negative impact on eating quality. Because of this and the industry's focus on delivering high eating quality outcomes for consumers, the index will be retired in March 2020.
- ✔ Carcass Plus will be replaced with the Terminal Carcass Production index. To assist in the transition between indexes both Carcass Plus and Terminal Carcass Production will be available for the 2019 ram buying season.
- ✔ The Terminal Carcass Production (TCP) index will give similar improvements in growth and lean meat yield as Carcass Plus while also maintaining eating quality.

What is the new TCP index?

Indexes help producers select animals for use within a breeding program when there are a range of traits of economic or functional importance. This ensures that genetic gain in one trait is not made in isolation from other traits. Using indexes in ram purchasing decisions allow producers to make balanced genetic progress towards more profitable sheep.

The TCP index has been created to assist producers to achieve both gains in their major production traits, such as post-weaning weight and muscling, as well as ensuring consumer satisfaction from lamb to be maintained through focusing on key eating quality traits such as shear force (tenderness) and intramuscular fat (marbling).

The TCP index is designed to suit a production system where:

- ✔ all progeny are terminal
- ✔ improving growth and muscle is of commercial benefit
- ✔ increasing lean meat yield has a positive financial impact
- ✔ a small degree of emphasis is included to maintain or improve eating quality.

Using the TCP index

The TCP index, unlike Carcass Plus, is on a scale that is aligned with other Sheep Genetics' indexes and is represented in economic terms with a unit increase in the index reflecting an additional dollar per ewe joined per year. To assist in comparing rams, Sheep Genetics recommends using a percentile band table as reference. The figure below, which is based on the percentile band table, highlights the TCP index value for significant percentiles for the 2018 drop animals.

Percentile band range graphic for TCP index 2018 drop animals

NOTES

*Agriculture
is woven through*
OUR DNA

Our people have a deep knowledge of agriculture right across the supply chain, and with many being from the land, they don't just understand farming, they live and breathe it.
